Full-stack software engineer experienced in designing and building scalable web applications across frontend and backend, with a focus on reliable architecture, problem-solving, and delivering user-focused solutions.

EXPERIENCE

Software Engineer

March 2025 – Present

Manatal | Bangkok, Thailand

- **Developed and deployed** RESTful APIs with **Django** and **FastAPI**, leveraging **Cursor** and **AI agents** as development collaborators to accelerate implementation, testing, and refactoring while maintaining code quality and scalability.
- **Implemented event-driven architecture** with **RabbitMQ**, allowing microservices to seamlessly respond to legacy monolith events and reducing system coupling.
- **Incorporated OAuth client** by integrating **Keycloak** with external service provider interface (SPI) and syncing user data from external monolith server in real time.
- **Engineered a custom, AWS IAM-style permission system** enabling per-role access overrides (role, action, resource → allow/deny), selectively applied to designated endpoints via a custom decorator to preserve backward compatibility.
- **Extended the MCP server** to expose existing API capabilities as **MCP tools**, enabling AI agents to interact with backend services while reusing established business logic and maintaining a consistent authorization model.
- **Delivered modern, responsive user interfaces** with **Vue.js** with **Vuex** for state management to ensure uninterrupted user experience.

EDUCATIONS

Humber College, Toronto, ON, Canada

Diploma of Computer Programming, Honors

January 2023 – August 2024

RMIT University, Melbourne, VIC, Australia

Bachelor of Aerospace Engineering, Honors

2015 – 2016

Kasetsart University, Bangkok, Thailand

Bachelor of Aerospace Engineering, Honors

2012 – 2015

CERTIFICATE

AWS Certified Cloud Practitioner

December 2025

Amazon Web Services Training and Certification

PROJECT

Satang | <https://github.com/tonytkl/satang>

- Designed and developed a serverless expense tracking application to manage transactions, wallets, categories, and budgets
- Built backend services using **Golang (Go)** deployed on **AWS Lambda** for scalable, event-driven processing
- Implemented RESTful APIs via **Amazon API Gateway** for secure and efficient client-server communication
- Modeled data using **DynamoDB (Single Table Design)** with optimized access patterns for high-performance queries
- Managed infrastructure as code using **Terraform**, enabling reproducible and version-controlled deployments
